

Name:

Enrolment No:

**UNIVERSITY OF PETROLEUM & ENERGY STUDIES**

**End Semester Examination (Online) – December, 2021**

**Program: MBA (Finance)**

**Semester: 3**

**Subject/Course: Financial Econometrics**

**Max. Marks: 100**

**Course Code: FINC 8009**

**Duration: 3 Hours**

**IMPORTANT INSTRUCTIONS**

- 1. This paper has four parts. Answer ALL questions.*
- 2. The use of scientific calculators is allowed*

**Part A: Answer ALL questions**

|           |  |                                 |            |
|-----------|--|---------------------------------|------------|
| <b>Q1</b> | Identify the following statements as True/False and give brief reasons.<br><br>a) Regression analysis is concerned with predicting/estimating the mean or average value of the dependent variables.<br>b) Dependence of crop on rainfall and temperature is deterministic in nature.<br>c) Correlation coefficient measures the linear association between variables.<br>d) How the sales of company has changed over the years is an example of 'Time series' data.<br>e) Correlation does not imply causation. | <b>2 × 5 =<br/>10<br/>Marks</b> | <b>CO1</b> |
| <b>Q2</b> | Answer the following questions:<br><br>a) The impact of advertisement expenses on sales is ..... in nature<br>i. Statistical<br>ii. Deterministic<br>iii. Both statistical and deterministic<br>iv. Neither of the above<br>b) The following are some of the stylized facts of financial data:<br>i. Non-stationarity<br>ii. Log normal prices   | <b>2 × 5 =<br/>10<br/>Marks</b> | <b>CO1</b> |

|  |  |  |  |

|--|--|--|--|

**Part B: Answer ALL questions**

| <b>Q3</b>          | Explain the significance of $R^2$ (coefficient of determination) in regression analysis.   | <b>5 Marks</b> | <b>CO2</b>  |         |             |         |                    |       |      |   |       |                 |       |       |   |       |                |            |
|--------------------|--|----------------|-------------|---------|-------------|---------|--------------------|-------|------|---|-------|-----------------|-------|-------|---|-------|----------------|------------|
| <b>Q4</b>          | Explain what you mean by Type I error and what you mean by Type II error in hypothesis testing.  | <b>5 Marks</b> | <b>CO2</b>  |         |             |         |                    |       |      |   |       |                 |       |       |   |       |                |            |
| <b>Q5</b>          | <p>The slope (<math>\beta_1</math>) and intercept (<math>\beta_0</math>) values of regression of Y on X are provided below for a sample of 39 observations. The standard errors are provided. Determine the t-statistic of <math>\beta_1</math> and <math>\beta_0</math>. With the p-values (2-tailed) given, determine whether <math>\beta_1</math> and <math>\beta_0</math> are individually significant or not at 5% level.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th></th> <th>Intercept</th> <th>Slope</th> <th>t-statistic</th> <th>p-value</th> </tr> </thead> <tbody> <tr> <td>Coefficient Values</td> <td>22.61</td> <td>1.75</td> <td>?</td> <td>0.310</td> </tr> <tr> <td>Standard Errors</td> <td>21.96</td> <td>0.065</td> <td>?</td> <td>0.000</td> </tr> </tbody> </table> |                | Intercept   | Slope   | t-statistic | p-value | Coefficient Values | 22.61 | 1.75 | ? | 0.310 | Standard Errors | 21.96 | 0.065 | ? | 0.000 | <b>5 Marks</b> | <b>CO2</b> |
|                    | Intercept  | Slope          | t-statistic | p-value |             |         |                    |       |      |   |       |                 |       |       |   |       |                |            |
| Coefficient Values | 22.61  | 1.75           | ?           | 0.310   |             |         |                    |       |      |   |       |                 |       |       |   |       |                |            |
| Standard Errors    | 21.96  | 0.065          | ?           | 0.000   |             |         |                    |       |      |   |       |                 |       |       |   |       |                |            |
| <b>Q6</b>          | What are some of the “stylized facts” of financial data? Discuss some of them in brief.  | <b>5 Marks</b> | <b>CO2</b>  |         |             |         |                    |       |      |   |       |                 |       |       |   |       |                |            |

**Part C: Answer ALL questions. Question 9 has internal choice**

|              |   |         |         |         |        |       |         |                     |             |        |
|--------------|---|---------|---------|---------|--------|-------|---------|---------------------|-------------|--------|
| <b>Q7</b>    | The ARIMA coefficients, Akaike and Schwarz-Bayesian information criterion (AIC and BIC) for an ARIMA(p,d,q) model with a stationary data (d = 0) are given below. Analyze the values given and comment on select the best model should be. With the given coefficient values, express of the model in simple equation form. |         |         |         |        |       |         | <b>10<br/>Marks</b> | <b>CO 3</b> |        |
|              |   | AIC     | BIC     | Mean    | AR(1)  | AR(2) | MA(1)   |                     |             | MA(2)  |
|              | ARIMA(1,0,0)  | 1237.02 | 1248.99 | 0.0126  | 0.7105 |       |         |                     |             |        |
|              | ARIMA(0,0,1)  | 1378.37 | 1390.34 | 0.0219  |        |       | 0.4585  |                     |             |        |
|              | ARIMA(1,0,1)  | 1193.28 | 1209.24 | -0.0132 | 0.8936 |       | -0.3907 |                     |             |        |
|              | ARIMA(0,0,2)  | 1277.17 | 1293.13 | 0.0217  |        |       | 0.4096  |                     |             | 0.4929 |
| ARIMA(2,0,0) | 1181.71   | 1197.67 | -0.0038 | 0.4503  | 0.3651 |       |         |                     |             |        |

|-----------|--|--|---------------------|-------------|
| <b>Q8</b> | As a finance manager of Co. X, you are evaluating the monthly sales of one of the products in your product line. You observe a seasonal pattern in your data. You notice seasonality in the data. You then fit the data in R using the ‘forecast’ package. The final model from the analysis is as below:    |  | <b>10<br/>Marks</b> | <b>CO 3</b> |
|           | $y_t = 78.15 + y_{t-12} + \varepsilon_t - 0.780\varepsilon_{t-12}$ <p>a) Comment on the type of ARIMA model used (3 Marks)</p> <p>b) Estimate the next month sales if next day <math>\varepsilon_t = 0</math>, <math>\varepsilon_{t-12} = -55.437</math>, and <math>y_{t-12} = 1976.56</math>. (7 Marks)</p> |  |                     |             |

|           |   |  |                     |             |
|-----------|---|--|---------------------|-------------|
| <b>Q9</b> | <u>Answer any one of the following:</u>   |  | <b>10<br/>Marks</b> | <b>CO 3</b> |
|           | <p><b>A)</b> In brief, describe the Box-Jenkins Methodology of time series analysis.</p> <p style="text-align: center;"><b>Or,</b></p> <p><b>B)</b> Comment on “Best Linear Unbiased Estimator” (BLUE) in regression. Describe the conditions that must be met for a regression to be BLUE.</p> |  |                     |             |

**Part C: Answer ALL questions. Question 11 has internal choice**

|            |   |           |                       |               |          |                     |            |                        |
|------------|---|-----------|-----------------------|---------------|----------|---------------------|------------|------------------------|
| <b>Q10</b> | You are fitting an Arbitrage Pricing Theory (APT) type model to explain the impact of Excess Market Returns or EMR ( $R_m - R_f$ ), changes in term-spread of Government Security (SPREAD), and changes in inflation rate (INF) on the excess stock returns or SR of Co. XYM ( $R_{XYM} - R_f$ ). The ANOVA table and coefficient values from the final model is given below: |           |                       |               |          | <b>15<br/>Marks</b> | <b>CO4</b> |                        |
|            | <b>ANOVA</b>  |           |                       |               |          |                     |            |                        |
|            |   | <i>df</i> | <i>Sum of Squares</i> | <i>Mean S</i> | <i>F</i> |                     |            | <i>Significance F</i>  |
|            | Regression  | 3         | 1.2248                | ?             | ?        |                     |            | $1.01 \times 10^{-34}$ |
|            | Residual  | 379       | 2.3141                | ?             |          |                     |            |                        |

|       |     |        |  |  |  |
|-------|-----|--------|--|--|--|
| Total | 382 | 3.5389 |  |  |  |
|-------|-----|--------|--|--|--|

|           | <i>Coefficients</i> | <i>Standard Error</i> | <i>t Stat</i> | <i>P-value</i>         |
|-----------|---------------------|-----------------------|---------------|------------------------|
| Intercept | 0.0094              | 0.0040                | ?             | 0.0201                 |
| EMR       | 1.2763              | 0.0920                | ?             | $1.14 \times 10^{-35}$ |
| SPREAD    | 0.0475              | 0.0171                | ?             | 0.0057                 |
| INF       | 0.0219              | 0.0121                | ?             | 0.0707                 |

- a) Determine the mean square of regression (MSR) and error (MSE) and determine the F-statistic. Comment on the significance of the regression model. (5 Marks)
- b) Determine the R-Square of the regression and interpret the same (4 Marks)
- c) Write the regression equation and forecast the excess stock returns if EMR = 0.0935; SPREAD = -0.055; INF = 0.4030 (6 Marks)

Answer any one of the following:

**A)** You are an analyst for firm Z. You are trying to determine the hedge ratio of a portfolio of investment against an index futures contract. You estimate the following regression coefficients:

|                       | <i>Coefficients</i> | <i>Standard Error</i> | <i>t Stat</i> | <i>P-value</i> |
|-----------------------|---------------------|-----------------------|---------------|----------------|
| Intercept             | -0.0021             | 0.0013                | ?             | 0.116          |
| Index Futures (slope) | 0.9018              | 0.2566                | ?             | 0.001          |

- i) Determine the t-statistic and R-Square of the regression if error sum of squares (SSE) is 0.005998 and the regression sum of squares (SSR) is 0.001235. (5 Marks)
- ii) Determine the F-statistic (no DF will be provided). (3 Marks)
- iii) Write down the regression equation and determine the 95% confidence interval for the regression slope if the values of t-distribution for the given DF and sample size is  $\pm 2.0003$  with a probability of 2.5% (on either tail). (7 Marks)

**Or,**

**B)** Miss X is the finance manager of an airlines company and would like to forecast the price of jet fuel for the next month. Miss X obtains the jet fuel prices for the past 36 months and fit an ARIMA model. Miss X conducted Augmented Dickey-Fuller (ADF) test on the fuel prices at level and at first difference. The estimate of the ARIMA model based on the appropriate series. The ARIMA(p,d,q) model is found as below:

**Q11**

**15  
Marks**

**CO4**

$$\hat{y}_t = y_{t-1} + 0.0055 + 0.737(y_{t-1} - y_{t-2})$$

Where,  $\hat{y}_t$  is the estimated value of jet fuel prices. The following p-values for ADF test is provided:

At level: Dickey-Fuller = -1.5349, Lag order = 4, p-value = 0.7641

At first difference: Dickey-Fuller = -4.0065, Lag order = 4, p-value = 0.0148

Further, Miss X knows that the oil prices for  $y_{t-1} = \$57.34$  per barrel and  $y_{t-2} = \$58.77$ .

- i) Interpret the results of ADF test and determine which series was used by Miss X and why. (5 Marks)
- ii) Explain the idea behind 'stationarity' of time-series data. Comment on how you will make a non-stationary data stationary. (5 Marks)
- iii) Interpret the above model. What would be the next month jet fuel prices if the above model is used? (5 Marks)
